Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and derived by analysis of the total score distribution.

The present sequence is a cond encoding when demptylicaliphter kinese. (MS Kinese), also known as adenosture's phosphosulphase kinese, this is obtained from a day add light groun when close with politic sed destructions of a sulphase. Such control sendings, wit could library, MS kinese is a sulphase, prosphosulphase (MS) to 'Prompton' destruction' and a sulphase. This sequence is used as a proble and primer too identify, obtain and synthesize sulphase suppless suppless assulption proteins from other plants. It is also used to produce transpentic plants, that we usefull for altering the expension of the country of New nucleic acid molecule and chimeric gene encoding an adenosine-5' phosphosulate kinase, useful for altering expression of sulfate assamilation protein in plants. Claim 3; Page 34-35; 42pp; English. assimilation protein in plants

The invention calcate of calculation of could sequence analysis enter involved in Defence to environmental stress in plants. This sequence (AAMS900-2685) are useful for producing a transparint plant having enhanced tolerance or resistance to environmental stress conditions such as nanecologic (Todonia -O.), delydeful tomor drought, leaf attess or salinity. This is useful for producing improved years of great in the salinity of the producing improved years of great in the hard and a such producing improved years of the salinity of the producing improved years of the hard and produced in the induced operators. Sequence SANASSOS 515 seprement producing environmental stress Loterance. isolation of polynucleic acids useful for producing transgenic plant by isolating genes involved in tolerance to environmental stress Claim 4; Page 218-220; 312pp; English.
